## Potential Energy

- ▶ While at rest, a portion of the string of length  $\Delta x$  is under the tension force  $T_0$ .
- ▶ When the segment of the string is displaced by  $u(x, t)$ , its length is approximately  $ds = \sqrt{1 + (u_x(x, t))^2} \Delta x$ .
- ▶ Assuming the displacement is small, then

$$ds = \sqrt{1 + (u_x(x, t))^2} \Delta x \approx \left(1 + \frac{1}{2} (u_x(x, t))^2\right) \Delta x.$$

- ▶ The amount by which the length of the segment of the string is changed is
- ▶ The **potential energy** in the string due to displacement  $u(x, t)$  is the work done against force  $T_0$  to stretch the string

$$P(t) = \frac{1}{2} \int_0^L T_0 (u_x(x, t))^2 dx.$$

## Conservation of Energy (1 of 2)

Differentiate the total energy with respect to time.

$$\begin{aligned} E'(t) &= \frac{1}{2} \int_0^L [2\rho u_t(x, t) u_{tt}(x, t) + 2T_0 u_x(x, t) u_{xt}(x, t)] dx \\ &= \int_0^L [c^2 \rho u_t(x, t) u_{xx}(x, t) + T_0 u_x(x, t) u_{xt}(x, t)] dx \\ &= T_0 \int_0^L [u_t(x, t) u_{xx}(x, t) + u_x(x, t) u_{xt}(x, t)] dx \\ &= T_0 \int_0^L \frac{d}{dx} [u_t(x, t) u_x(x, t)] dx \\ &= T_0 [u_t(x, t) u_x(x, t)]_{x=0}^{x=L} \\ &= T_0 [u_t(L, t) u_x(L, t) - u_t(0, t) u_x(0, t)] \end{aligned}$$

## Total Energy

The **total energy** is the sum of the kinetic and potential energies.

$$E(t) = \frac{1}{2} \int_0^L [\rho (u_t(x, t))^2 + T_0 (u_x(x, t))^2] dx$$

## Conservation of Energy (2 of 2)

$$E'(t) = T_0 [u_t(L, t) u_x(L, t) - u_t(0, t) u_x(0, t)]$$

Since  $u(0, t) = u(L, t) = 0$  for all  $t \geq 0$  then  $u_t(0, t) = u_t(L, t) = 0$ .  
Consequently  $E'(t) = 0$  and total energy is conserved.

The total energy for any  $t \geq 0$  is the initial energy present in the string.

$$\begin{aligned} E(t) &= E(0) = \frac{1}{2} \int_0^L [\rho (u_t(x, 0))^2 + T_0 (u_x(x, 0))^2] dx \\ &= \frac{1}{2} \int_0^L [\rho (g(x))^2 + T_0 (f'(x))^2] dx \end{aligned}$$

## Uniqueness of Solutions

### Theorem

*The solution to the initial boundary value problem:*

$$u_{tt} = c^2 u_{xx} \text{ for } 0 < x < L \text{ and } t > 0$$

$$u(0, t) = u(L, t) = 0$$

$$u(x, 0) = f(x)$$

$$u_t(x, 0) = g(x)$$

*is unique.*

## Proof

- ▶ Suppose there exist two solutions  $u_1(x, t)$  and  $u_2(x, t)$  and define  $v(x, t) = u_1(x, t) - u_2(x, t)$ .
- ▶ Function  $v(x, t)$  solves the following initial boundary value problem.

$$v_{tt} = c^2 v_{xx} \text{ for } 0 < x < L \text{ and } t > 0$$

$$v(0, t) = v(L, t) = 0$$

$$v(x, 0) = 0$$

$$v_t(x, 0) = 0$$

- ▶ The total energy of solution  $v(x, t)$  is 0 which implies  $v_t(x, t) = 0$  and  $v_x(x, t) = 0$  which implies  $v(x, t)$  is constant and therefore  $v(x, t) = 0$ .
